

Pin holder tool

You can melt the glass direct on the surgical steel pin without any bead release. You can hold the pin in the flame with this tool. Please screw strong the pin into the tool with pliers. The steel pins get a dark patin in the flame.

If you melt a glass on total length of the rods, please let free the end of pins or cover the end (3-4mm) of the pin with "bead release". You can melt the glass just on the last 3-4mm of the pins without bead release too. To remove this patin polish the pin (if the pin is visible).

Please heat the pin gently. Pin is very slim, if you heat it to long, you can melt it!

Please use plier jently on metal parts. Tool is 20 cm long.
